

## Polyurea

Waterproof versions of our planters are also available. The insides of these planters are sealed with a polyurea plastic coating.

Polyurea plastic coating is a two-component polymer with high molecular density. When the two components are mixed together, an exothermic reaction occurs, resulting in a very tough and highly elastic protective layer. We apply the coating to the inside of the planter, which makes the planter waterproof.

**Note!** A waterproof planter with polyurea coating is not suitable for use as a pond. Our ponds are given additional reinforcements to prevent deformation due to water pressure.
